

wget (tool for downloading files)

When you work on the command line, you have a full-featured Internet download manager at your fingertips: *wget*. Invoke the program like so:

```
wget URL
```

This will download the file specified by *URL* to your computer. When a download is interrupted, you can resume it by specifying the option `-c`("continue"):

```
wget -c URL
```

Call *wget* with the option `-m` ("mirror") to create a local copy of a website:

```
wget -m URL
```

If you're curious about the many other features that *wget* has to offer, check out the program's excellent →[man](#) page.
